Fact Sheet

Yellow Fever

What is yellow fever?
Yellow fever is a tropical disease that is spread to humans by infected mosquitoes.

How common is yellow fever?
Yellow fever is only found in parts of South America and Africa.

How is yellow fever spread?
Yellow fever is spread from the bite of an infected female mosquito. The mosquito injects the yellow fever virus into the bite.

What are the symptoms of yellow fever?
Symptoms start 3 to 6 days after exposure. Cases of yellow fever range from mild to severe. Initial symptoms include fever, headache, vomiting, backache, and muscle aches. As the disease progresses, the infection can lead to shock, bleeding, and kidney and liver failure. Jaundice, a yellowing of the skin and the whites of the eyes, occurs as the virus attacks the liver.

Are there complications from yellow fever?
Severe yellow fever infections can be fatal.

What is the treatment for yellow fever?
There is no specific treatment for yellow fever. People infected with yellow fever should rest and drink plenty of fluids. They should be kept from mosquitoes to protect others. Most people get better after a long recovery period.

How can yellow fever be prevented?
A person traveling to areas where yellow fever exists should receive the vaccine. Check the Centers for Disease Control and Prevention’s website for information where yellow fever is found (http://www.cdc.gov/travel/index.htm).

People should also take precautions to protect themselves against mosquito bites, such as wearing long-sleeved clothing and long pants, using insect repellent on clothing, skin, and in living areas, and using a bednet when sleeping.
