Washtenaw County Health Department Alerts Public to Second Suspect Measles Case and Additional Public Exposure Locations

Anyone exposed should monitor for symptoms for 21 days and call ahead before seeking medical care

YPSILANTI, Mich., March 12, 2026 – Washtenaw County Health Department is reporting a second suspect case of measles in a Washtenaw County unvaccinated individual and announcing two additional exposure locations related to the first case.

“Unfortunately, we expect to see additional cases in exposed, unvaccinated individuals, as measles is very contagious,” says Juan Luis Marquez, MD, MPH, medical director with Washtenaw County Health Department.

“This is an ongoing investigation. We have now identified two more potential exposure locations related to the case announced yesterday,” continues Dr. Marquez.

The measles virus can live for up to two hours in the air, and individuals who were present at the following locations during the listed dates and times may have been exposed to the measles virus:

Table with 3 columns: Date, Location, Time. Rows include exposure locations like Crunch Fitness, Sidetrack Bar & Grill, Briarwood Mall, T-Mobile, Cricket Wireless, and CVS Pharmacy with their respective dates and times.

Washtenaw County Health Department
555 Towner Street • Ypsilanti, MI 48198
Phone: 734-544-6700 • Fax: 734-544-6705

	2547 Ellsworth Rd, Ypsilanti, MI 48197	
Sat, March 7	Ypsilanti Urgent Care Walk-In Clinic 301 W Michigan Ave #100, Ypsilanti, MI 48197	7:15 pm to 9:27 pm
Sun, March 8	Canton Urgent Care Walk-In Clinic 43033 Ford Road, Canton, MI 48187	4:30 pm to 7:00 pm

*\*These locations and times were identified and added on 3/12*

**Anyone at the above locations during the specific times and dates should monitor themselves for symptoms of measles for 21 days after the exposure.** If symptoms appear, call your health care provider. Do not seek medical treatment in person without calling the doctor's office, urgent care, or emergency room first.

"The new, suspect case has been quarantined since the exposure to the first case was identified," says Dr. Marquez.

Individuals with two, appropriately spaced doses of measles vaccine (MMR) are considered immune. Additionally, adults born before 1957 or those who have evidence of prior measles illness are considered immune. For children, the first dose of MMR vaccine is routinely given at about 12 months of age, and the second starting at 4 years of age. The first dose can be given as early as 6 months. Contact your health care provider, pharmacy, or local health department for vaccination and guidance.

**For those who are not already immune to measles, medication (IG) may be given after exposure in some instances to prevent measles (post-exposure prophylaxis):**

- Immune globulin (IG) is medicine that can prevent illness in high-risk individuals up to six days after exposure. High-risk groups include infants under one year old and pregnant or immunocompromised individuals. Contact your health care provider for IG.
  - High-risk individuals exposed at the CVS on 3/6 or the Cricket Wireless on 3/6 can get IG through 3/12.
  - High-risk individuals exposed at the Ypsi Urgent Care Walk-In Clinic on 3/7 can get IG through 3/13.
  - High-risk individuals exposed at the Canton Urgent Care Walk-In Clinic on 3/8 can get IG through 3/14.

The two new exposure locations identified today (3/12) are outside of the timeframe for post-exposure prophylaxis.

### **Measles**

Measles is a highly contagious, vaccine-preventable disease that is spread by direct person-to-person contact, and through the air. Symptoms of measles usually begin 7-14 days after exposure, but can appear up to 21 days after exposure and may include:

- High fever (may spike to over 104 °F)
- Cough
- Runny nose
- Red, watery eyes (conjunctivitis)
- Tiny white spots on the inner cheeks, gums, and roof of the mouth (Koplik Spots) 2-3 days after symptoms begin
- A rash that is red, raised, and blotchy that usually starts on face, spreads to trunk, arms, and legs 3-5 days after symptoms begin

If symptoms develop, please call your doctor, urgent care, or hospital before seeking treatment.

### **Measles (MMR) Vaccine**

The measles vaccine is highly effective and very safe. A single dose of measles vaccine is about 93% effective at preventing measles, while two doses are about 97% effective. It is also effective if used within 72 hours of measles exposure to prevent illness. Getting vaccinated not only protects the individual receiving the vaccine but can also protect vulnerable individuals in our communities from being exposed to this illness.

Anyone not fully vaccinated against measles is encouraged to do so as soon as possible. About one in five people who get measles will be hospitalized. The Washtenaw case announced yesterday is the first reported in Michigan in [2026](#). As of March 5, there are 1,277 confirmed measles cases in 31 United States jurisdictions, including Florida.

Across the United States and in Michigan, routine immunization coverage has dropped. Statewide, coverage for the MMR vaccine (two doses) for children ages 4 to 6 years old has decreased from 89% in 2017 to 66% to date, according to the Michigan Department of Health and Human Services. As of January 2026, MMR coverage for 4- to 6-year-olds in Washtenaw is 70%.

Vaccination is available from health care providers, pharmacies, and health departments. Children eligible for the [Vaccines for Children](#) program may receive the vaccine from a provider enrolled in that program at no-cost. The Washtenaw County Health Department accepts Medicaid, Medicare, Washtenaw Health Plan, and Blue Cross Blue Shield of Michigan. The Health Department does not decline services if individuals are unable to pay.

Call 734-544-6700 to schedule a vaccine appointment at the Health Department, or walk-in during these hours to 555 Towner in Ypsilanti:

- Tuesdays from 8:30 am to 3:30 pm
- Thursdays from 8:30 am to 3:30 pm
- Fridays from 8:00 am to 3:00 pm
